rice invention trainers to a purition number for the GPCR).

CC freedprox (GPCR) polypeptide and the nucleic acids encoding it

(including 5' and 3 sequences, promoters, fragments, variants, or a

cc freedprox (GPCR).

Also included are an expression vector comprising the nucleic acid,

Also included are an expression vector comprising the nucleic acid,

a host cell containing the vector and the identification of modulators of

the GPCR especially those that reduce the acitvity of the GPCR.

The nucleic acid is useful for detecting a polynucleotide encoding

the GPCR in a biological sample. The GPCR and nucleic acid are useful for

CC screening for agents which decrease the activity of the GPCR and

cc screening for agents which decrease the activity of the GPCR and

cc screening for agents. The modulator or agent useful for modulating

cc bacterial, fungal, protozoan, and viral infection, pain, cancer,

anorexia, bulimia, asthma, central nervous system (CNS) disease such as

concexia, diabetes, angina pectoris, moradial infarction, ulcer,

confinammation, allergy, multiple sclerosis, benign prostatic hypertrophy,

cc flummation, allergy, multiple sclerosis, benign prostatic hypertrophy,

cc flummation immunodeficiency virus), CNS discorders such as Parkinson's

cc flummating retardation, Huntington's disease and Tourette's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel human P2Y1-like G protein-coupled receptor polypeptide which can be regulated for treating infection, pain, cancer, diabetes, anorexia, asthma, hypertension, neurological disorder and dyskinesia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240 TIGCTITCCTGTGCACCTTCCCATCCTGATAAGAGTTATGCCAAI---GATAAGGGGA 296

Novel isolated G-protein coupled receptor peptide useful for treating disorder characterised by absence of, in appropriate or unwanted expression of the receptor protein, and as immunogens to raise antibodies

Claim 23; Fig 1; 64pp; English.

therapeutic proteins; assays designed to quantitatively determine levels of the protein in biological fluids; identifying compounds which modulate the activity of the GPCR, or the interaction of the GPCR and a molecule with which it normally interacts; and treating a disorder characterised by an absence of, or inappropriate expression of the GPCR protein. The GPCR nucleic acids of the invention are useful in diagnostic assays to identify changes in the GPCR nucleic acid that lead to pathology; controlling GPCR expression; and in gene therapy to treat patients with aberrant GPCR gene expression. The GPCR nucleic acids can also be used in the production of transgenic animals. The present specifically claimed human cDNA sequence (located on chromosome 13) encodes a purinergic-related G-protein coupled receptor (GPCR) of the invention. GPCRs constitute a major class of proteins responsible for signal transduction within a cell. Upon binding of a ligand to the extracellular portion of a GPCR, a signal is transduced of GPCR proteins can be divided into five families, family I contains the purinergic GPCRs (e.g. the P2Y receptors). P2Y receptors are characterised by their selective responsiveness towards APP and its analoques, some also respond to UTP. The invention comprises a human G-protein coupled receptor protein and encoding nucleic acids. The GPCR protein and nucleic acids of the invention are useful in the treatment of a disease or condition mediated by a human protease. The GPCR protein of susfell for: the development/identification of

(I) and related mRNA, cDNA, protein, antibodies etc., are used for diagnosis and (gene) therapy of diseases that are (in)directly associated with (I) or its expression products. No diseases are specified but as (I) is expressed only in thyroid tissue, (I) is pressmed to be involved in regulation of thyroid function. The present sequence is that of the P2XIIi encoding CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human P2Y111 gene, useful for treatment and diagnosis of associated diseases, and related proteins, antibodies and modulators, encodes {\tt G}

Novel isolated 26904, 38911 and 39404 polypeptides which are seven transmembrane proteins belonging to superfamily of G-protein-coupled receptors, useful for treating disorders of spleen, lung, liver, brain

Claim 2; Fig 1; 164pp; English.

The sequence encodes a novel human seven transmembrane domain

protein belonging to the G-protein coupled receptor (GPCR) superfamily,

control 39404. The receptor is useful in drug screening assays, to

identify compounds that modulate receptor activity and/or interact with

the receptor, and for producing antibodies specific for the receptor, its

control and 39404 protein associated disorder characterised by

aberrant expression or activity of the protein, for monitoring

aberrant expression or activity of the protein, for monitoring

characteristic during clinical trials and other treatment, as bait

proteins in a two-hybrid or three-hybrid assay, and in pharmacogenomic

analysis. The proteins and nucleic acids encoding them are useful for

characteristic and treatment of disorders selected from disorders of the

spleen, lung such as Good pasture's syndrome, liver such as viral

chaptitis, brain such as Alzheimer's disease, haematopoietic stem cells

such as lymphoma, kidney such as Heymann nephritis, bone such as Paget's

disease, colon such as Crohn's disease, uterus and endometrium such as

chapticis, T-cell disorders such as systemic lupus erythematosus,

diseases of the skin such as actinic keratosis, disorders of the heart

conditions disorders involving blood vessels such as Kawasaki

conditions disorders involving blood vessels such as Kawasaki syndrome, disorders involving the thymus such as DiGeorge syndrome, disorders involving B-cells such as peripheral B-cell neoplasms, disorders of the breast such as inflammations, and disorders involving the testis and epididymis such as teratoma. Numerous examples of each type of disorder are given in the specification.

Sequence 1729 BP; 461 A; 403 C; 302 G; 563 T; 0 other;

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
